FOREWORD

The statistics in this publication represent state and county data for the period of 1980 to 1984. Regular Census revisions in state data have been completed and are reflected in the revised data. Data published in the 1982 Census of Agriculture were given primary consideration in establishing revised levels of estimates for the counties. For a few crops, the revisions are rather large at the county level; however, for crops like tobacco, cotton and peanuts, no revisions were necessary.

State and county estimates of crops for the years 1975-1979 remain as presented in the publication titled "*South Carolina Crop Statistics*", AE 417. Crop statistics in the following AE publications are superceded: AE 421 and 431. Also included are data on number of farms, land in farms, commercial fertilizer, fruit and vegetable statistics and quarterly on and off farm grain stocks estimates.

This bulletin, is a cooperative effort between the Statistical Reporting Service of the United States Department of Agriculture, and the Department of Agricultural Economics and Rural Sociology and South Carolina Agricultural Experiment Station of Clemson University. This cooperative relationship increases efficiency by avoiding duplication of effort and conflicting reports. The Federal program serves to provide comparable statistics for all states, which are released in national reports, while State funds make it possible to prepare and publish more detailed statistics for South Carolina such as those presented in this Bulletin.

We are indebted to thousands of South Carolina farmers who voluntarily give their time and effort to report various information relating to their farming operation. Without this voluntary cooperation, it would be impossible to make reliable estimates or compile this publication. Thanks to all of you who assist in this effort. In addition to the voluntary reporters, I want to publicly thank my staff for their dedication in preparing this bulletin.

Sincerely,

Roger M. Foster
Agricultural Statistician
In Charge

The South Carolina Agricultural Experiment Station is a cooperative program financed from federal and state funds. It is the policy of the Experiment Station to comply with the regulations of Title VI, the Civil Rights Act of 1964. Complaints may be filed with the Director, S.C. Agricultural Experiment Station, Clemson University, Clemson, S.C. 29631.

1984 SOUTH CAROLINA CROP SUMMARY

JANUARY: Temperatures for January were above normal early in the month but dropped to below normal temperatures from mid-month to the end of the month. Heavy rains fell statewide on the 10th amounting to over 3 inches in the western and northern parts of the state and causing rivers to overflow. Moderate rainfall continued over the state the rest of the month.

Early month activities saw growers checking fruit trees for cold injury. The month's farm activities included pruning trees, testing soils, applying lime, caring for livestock, repairing machinery, and planning farm activities and marketing strategies for 1984.

FEBRUARY: February temperatures were colder than usual early in the month but climbed rapidly after the first week. Rains changed to snow mid-month and returned to rains around the 19th leaving 1 to 2 inches accumulation.

Growers were fumigating or planting tobacco beds and top dressing pastures and small grains early in the month. Farmers began preparing crop land for spring planting. Major peach varieties began blooming late in the month with blooming being slowed by cool nights. Farmers continued general farm chores and tobacco bed conditions looked good for the month.

MARCH: Early month temperatures were cooler than usual, but temperatures rose to warmer than normal after mid-month. Rainfall averaged $\frac{1}{2}$ to 2 inches mid-month and became heavier than normal the last week of March. Some wind and hail damage occurred the 24th and 25th. The last week in March included warm, humid weather with damaging hail and windstorms the 28th. The most severe tornado in years passed through the state, extensively damaging homes, trees, and crops. Some scattered frost was reported Upstate, with moderate to locally heavy rainfall over the rest of the state mid-week.

Early peach varieties began widespread blooming with cold injury being minimal. Farmers began putting down plastic for watermelons early in the month. By mid-March farmers began planting coastal tomatoes, corn, and other vegetables. Orchards of peaches and other fruits were also sprayed. By the end of March, watermelon planting was underway with the earliest plantings emerging. Tobacco beds were in good condition with transplanting starting. Wet fields delayed nitrogen applications to small grains. Peaches were in full bloom and past full bloom in some areas of the state. Corn, tobacco, and vegetable plantings were held back and outdoor work in many areas consisted of cleaning up storm debris.

Some plowed fields had heavily eroded soils due to heavy rains and high winds. The peach condition was reported to be good statewide. Small grains were in fair to good condition despite some leaching of nutrients due to excessive rains.

APRIL: Temperatures for most of April averaged below normal. Soil moisture was adequate to mostly surplus for the month. Field preparation and planting saw continued delays due to heavy rains, thunderstorms, and hail. One to two inches of rain fell during each of the last two weeks of April. Late April temperatures were near or slightly above normal.

Rains and wet fields held back most field preparation and planting during April. Corn, tobacco, and vegetable planting progressed only where tractors could get into fields. There were some preparations underway for planting cotton, peanuts, and soybeans. Germination and crop growth and development were slowed by cool weather. Corn planting progressed slowly due to wet fields keeping out equipment. Alfalfa, clover, grain hay and silage harvest began near the end of the month and growers were preparing fields for early soybean plantings. Cotton and tobacco plantings were rapidly increasing. Surplus rains leached nitrogen and fertilizer from some tobacco beds.

MAY: Early May weather included showers, thunderstorms and localized wind and hail damage. All areas of the state received above normal rainfall with the heaviest downpours in the northwest. Starting with the second week in May the month was practically rainless. Early May and mid-May temperatures were below normal, but the end of May saw temperatures climbing to above normal marks. Soil moisture was mostly surplus the first two weeks of May and fell to adequate to short readings the last two weeks of May.

Early May high moisture weather delayed land preparations and field work for the majority of the state. Sulfur and nutrient deficiencies were evident in corn due to heavy rains and leaching. Leaching also continued to be a problem in tobacco fields where large amounts of fertilizer were applied. Early month winds and heavy rains blew over many small grains in the state. Cotton producers had to replant large portions of their crops due to winds and rains. Mid-May farm activities accelerated as farmers raced to catch up. Late corn planting and soybean planting became active over the state, but many areas reported needing rain showers to aid germination in the newly planted fields. Tobacco varieties began to bloom prematurely due to unusually cool nights. By late May the condition of the cotton crop had improved and looked better due to warmer weather. Late planted corn was off to a slow start and was turning color due to spotty, dry weather conditions.

JUNE: Weather during June was mostly rainless with temperatures usually averaging above normal. The first week and last week of June were wet, but the rest of June saw high temperatures, sunny skies, and low humidities. Mid-June weather conditions produced high evaporation rates. Soil moisture for June was short to adequate.

Early June rain delayed field activities in much of the state, but a few areas saw excellent conditions for continued field operations. Dry soils and hot temperatures were very favorable for combining small grain, but some other crops were in need of rain. Cotton progressed slowly in June due to dry weather conditions. Soybean planting was also slowed due to dry weather conditions. The corn crop needed rain badly, as did melons and most vegetables. The last week of June saw rain showers arrive that relieved agricultural crops of previous hot and dry weather conditions. Dry soil conditions were corrected in many areas. A few counties continued to report very dry weather and moisture stressed crops. Soybean planting picked up in areas that received rain. The end of June brought steadily increasing harvest of peaches, especially in the Piedmont counties. Harvest was mostly complete for small grains with excellent yields being reported.

JULY: Wet weather conditions were prominent during July. Temperatures were lower than usual for most of the month, with a few short periods of hot weather. Thunderstorms were frequent with more rain received for the month Upstate and Midlands, less rain along the Coast.

Corn yields improved from June hot weather conditions due to frequent rainy weather in July. Early July corn conditions were less promising than late-July indications. Previous dry weather conditions during the corn pollination stage indicated that despite relief from dry weather, yields would be below earlier indications. Peanut conditions were fair to good with growers expecting an excellent crop. A few areas reported occurrences of white mold and leaf spot in peanuts. The soybean condition was good for July. Weed control was a major activity of growers, especially due to rainy weather. Blooming in July was behind the previous year but the crop was reportedly progressing well. July tobacco harvest was well ahead of this time last year, even after excessive rains slowed harvesting in some areas. Soil moisture for the month improved the condition of tobacco.

Peach harvest progressed well during the month and was 4 percent ahead of the crop harvested in 1983. The general peach condition was good. Low levels of disease were reported in July due to excessive moisture in orchards. The July apple condition was excellent to good. Growers encountered difficulty in keeping pesticides on the orchards due to rain. Ninety-five percent of the tomatoes in the state were harvested by mid-July. Tomato production and yields were up from 1983 and the crop was high quality. Tomato prices were reported to be very low. Watermelon and cantaloupe harvest was nearing completion by the end of the month. Melons were also good quality.

AUGUST: August weather provided good growing conditions for most crops. The early part of the month was wet and showers threatened crop quality. Weeds were also very bad. However, mid and late August hot temperatures improved crop quality. Some areas of the state needed more rain by late August.

Crop quality was reported as good for most of the month, with soil moisture being adequate. Corn harvest increased throughout August with yields expected to be good. Soybeans were blooming and growing well with infestation of insects reportedly light. The cotton crop looked good in August and grew at a rapid pace. Cotton also was fruiting well. Insect infestation was low in cotton. Tobacco harvest continued at a very fast pace, with crop quality excellent for the month. Peach harvest slowed down and was very near completion by late August. Brown rot was a problem in some areas, especially the Ridge and Piedmont. Prices were very low for peaches in August. Apples and grapes continued to look excellent with harvest slightly ahead of last year for both crops. Preparations were beginning in late August for the planting of alfalfa and small grains. High infestations of insects were evident in many pastures during August.

SEPTEMBER: Early September weather saw most crops in good to excellent condition, although rain was needed to keep crops this way. Mid-September weather brought no rain and resulted in extremely drought stressed crops. Temperatures at mid-month were cooler than normal. Some responsibility for cooler temperatures could be attributed to Hurricane Diana and tropical storm Isidore. Late September weather brought no reprieve to the month's dry spell. Temperatures continued to be low, but light rain the last week-end of the month was the only considerable moisture brought by the storms.

Crop quality deteriorated, in general, from good to excellent in early September to poor to good in late September. Soybeans continued to look good early in the month with the crop blooming and podding well. Weed pressure was heavy in many fields, with some areas reporting heavy insect pressure. Over the rest of the month soybeans became extremely drought stressed. Velvetbean caterpillars and stink bugs continued to build up in the crop. Late month weather conditions caused premature defoliation of many beans. It was still questionable as to the extent that the end of the month rains revived the crop. Corn harvest continued through September with dry weather having little affect on the already mature crop. Southern leaf blight affected yields of late-maturing corn. Yield expectations continued to be slightly above normal. Cotton maturation progressed well through September. Early September dry soil conditions caused cotton to "cut-out". Rotting of bolls was slowed by dry weather conditions. Harvesting of cotton began after mid-September with cotton conditions statewide reported as good. Sorghum harvest continued through the month with corn earworms a problem in the early part of September. Insect pressure decreased mid-month with European corn borer causing heads to drop in some fields during late September. The condition of sorghum for the month was fair to good. Peanut harvest began in mid-September with yields reportedly looking good. Weather late in the month made many fields too dry and hard for digging. Peanut harvest fell slightly behind percent harvested the previous year. The statewide September peanut condition was fair. Apple harvest continued in September with production and quality high. Prices received by farmers were low during September. Harvesting for the month continued to be ahead of percent harvested last year. The September statewide condition of apples was excellent. Grapes in South Carolina continued to look excellent through September. Harvesting progressed at a rapid pace through the month. Fall cucumber harvest started after mid-month. Where showers were, a good crop was reported. Downy mildew caused problems in some cucumber fields. Production of this year's crop was slow with warmer weather and more rain needed. Sweetpotato harvest began around mid-September. Reports indicated a good crop was being dug. Rainfall was needed badly in September for pastures and planting winter grazing lands. Field preparations for small grain planting were delayed during the month due to lack of moisture. Haymaking was a major activity during much of the month. Conditions of hay and pastures deteriorated considerably during the month due to lack of moisture.

OCTOBER: Dry weather occurred over the state during October continuing September's dry weather trend. Early month general showers helped crop conditions some; however drought stressed crop conditions were apparent. Virtually all counties over the state reported a need all month for more rain to further crop maturation and development. Unseasonably warm weather persisted over South Carolina during the month with general showers reported over much of the state near the end of October.

Lack of moisture during October greatly stressed soybeans. Some areas reported that beans were in relatively good condition, but others reported a near disaster crop. In general though, soybeans were damaged considerably by October's dry weather. Dry weather conditions also led to premature defoliation of plants and small beans in pods. Harvest began in October with the end of the month percent harvested ahead of percent harvested at this point last year. The general soybean crop condition for the month was fair. The cotton crop was in very good shape during October and benefitted from the dry weather. Yields and crop quality were reportedly high. Harvesting and ginning of cotton expanded during the month and the general condition across the state was reported as fair. Sorghum and peanut harvesting continued during the month. Yields were reported as good for both crops. The general condition statewide of both crops was fair to good.

Apple harvest finished up by mid-month with the last varieties being picked. Crop quality continued to be excellent to the end. Orchard clean-up began in October. Although pecan harvesting did not start in October, crop prospects looked very good and the condition of the crop across the state was fair to good. Harvest of the fall vegetable crop, including fall cucumbers, wound down near the end of the month. The crop condition was reported as good, but dry weather did adversely affect yields. Planting of small grain and winter grazing crops was considerably slowed during the month by dry weather conditions. Germination of seeds for small grains and winter grazing was hampered. Moisture received near the end of the month did assist farmers in fall tillage and in reviving the seedlings. Pastures were short during the month with hay feeding of livestock continuing. With the little rain received over the state at the end of the month the small grain and pasture conditions were improved to fair and the livestock condition also was reported as fair. In general, dry weather assisted farmers in cotton, peanut, and sorghum harvesting but hampered the development of other crops during the month of October.

NOVEMBER: Early month temperatures were higher than usual with a cold weather front bringing some rain. The rest of November saw colder temperatures than normal with the first freezing temperatures reported near the middle of the month. Dry weather continued during the month with light rainfall recorded in some areas.

Harvesting of soybeans continued through November with the general crop condition reported as fair. Weather conditions continued to be good for harvesting with percent harvested thus far this year considerably ahead of percent harvested at this time last year. Yields were reported to be good although small beans were prominent. Cotton harvest continued at a brisk pace during November with crop yield and quality reported as excellent. Cotton harvest was nearing completion by the end of November. Picking was good for the month with mid-month frosts killing cotton regrowth and bringing to an end this year's boll weevil eradication program. Peanut and sorghum harvesting continued during November with peanut harvest ending near the end of the month. The general condition of both crops during November was fair to good. Pecan harvest got underway during the month with good yields reported and an excellent quality crop reported. The crop condition for the month was fair to good. Land preparation and planting of small grains continued during November with many counties reporting the need of rain to help small grain emergence. Mid-month light rains did help small grain and grazing land. The general conditions of small grains (wheat, rye, oats, and barley) were fair to good for the month. The percent planted of all small grains was the same as or above the percent planted by the end of November last year. Pastures in the state were looking better in November, but they were slow to recover from the late summer drought. Pasture conditions statewide were reported as fair.

DECEMBER: Weather conditions in December were the warmest since 1971. Light showers fell over the state off and on during the month delaying soybean and cotton harvesting in some areas. Rains during the month improved conditions for land preparation and small grain planting. Soybean and cotton harvest was near completion around Christmas. The month's warm temperatures and adequate moisture stimulated growth of winter grazing and small grain crops. End of the month farm activities included fumigating tobacco beds and doing routine chores and equipment maintenance. Pruning and planting of new trees was also being done near the end of December.

Usual Planting and Harvesting Dates in South Carolina

**1984 VEGETABLE ACREAGE
HARVESTED UP 10 PERCENT**

South Carolina's **acreage harvested** of all vegetable and small fruit commodities produced in 1984 was 44,116 acres, up 10 percent, compared to 40,065 acres harvested in 1983. Although 1984 watermelon acreage decreased, most commodities showed an increase in harvested acreage from 1983. Watermelon acreage harvested decreased by 8 percent in 1984, while acreage harvested of cucumbers for pickles, tomatoes, sweetpotatoes, and fresh market cucumbers increased 4 percent, 1 percent, 43 percent, and 2 percent, respectively. Numerous other commodities also showed increases in harvested acreage for 1984.

South Carolina's **value of production** of all vegetable and small fruit commodities increased 35 percent in 1984 from 1983's \$46.8 million to \$63.2 million in 1984. The value of all major commodities increased from 1983 with the exception of cucumbers for pickles which decreased 20 percent in 1984. The value of production for watermelons, sweetpotatoes, tomatoes, and fresh market cucumbers increased 101 percent, 27 percent, 35 percent, and 11 percent, respectively.

More detailed information on the 1984 vegetable survey is published in the "South Carolina Vegetable Statistics--AE434, March 1985.

1/Yield, production and average price in dozen bunches. 2/Includes: broccoli, kale, beets, mustard greens, honeydews, pumpkins, spinach, asparagus, cherry tomatoes, eggplant, turnips and other processing vegetables.

SOUTH CAROLINA FARM NUMBERS CONTINUE DOWNWARD

The number of farms in SOUTH CAROLINA in 1983 is estimated at 29,000 down 2,000 from 1982. For 1984, farm numbers are expected to drop another 1,000 to 28,000. Total land in farms was 5.8 million acres in 1983, down 3 percent from 1982. The preliminary estimate for 1984 land in farms is 5.6 million acres, also down 3 percent from a year earlier. Average size of farm in 1983 and 1984 is 200 acres.

The number of farms in the UNITED STATES in 1984 is estimated at 2.33 million, down 2 percent from the 2.37 million in 1983 and 3 percent below 1982. Total land in farms for 1984, is 1,020 million acres, down fractionally from 1983 and 1 percent below 1982. Average size of farm in 1984 is 437 acres, 5 acres larger than 1983 and 9 acres larger than 1982.
